

Do conflicts fall across the morphosyntax/phonology divide?

Hypothesis (ii) predicts the blue point to the right of the open one.

○ If conflicts ignored the divide ● Observed

Syntax side: morphosyntactic, indeterminate (CCDB); morphosyntactic, tonosegmental, length (Chichewa).

Phonology side: phonological (CCDB); phonological, intonational (Chichewa).

A span on both sides shares a side with anything, so its conflicts count as within a side.

p: how often shuffling the spans' sides gives a share across the divide at least this high.

* not from CCDB (Chichewa).
